

hours we spend on it they accomplish a certain percentage of work.

(Discussion follows.)

Leader: Course the only consideration we have here is because my house is located on sandrock and yours is located in blow sand. Uh..why shouldn't I get more credit for beating this rock than you for simply shoveling blow sand.

(Participant, man:) Well..we..more or less in the group of these four, five or six houses. Say they necessarily won't be concerned with their own house well they'll be concerned with the whole community there. There's..it basically it's a community project. And if he gets his hours in I suggested to Mr. Tompkins on something on the family basis that some little incentive for the family to get their, the first family to get their allotted time in on this house. Some little incentive to get this job and and uh..

(Mr. Clement:) I have a question that, I have three participants that have a request to have a storm cellar made under the house. Would that be possible at their own expense now? They don't want it out of it. At least a 10 x 10 or a 10 x 12. Is that possible?

Mr. Clement: We, we, have..we have tried and tried on these storm cellars on conventional projects under the M & M building. And I think the regulation out of Washington, if it doesn't affect the structure more than one percent we can do it. How this would work is a complicated operation and uh granted you've got a hazard there. We just can't buy 10 x 6 or however deep it is. Uh might change his proposal uh how long it would take the participant to get the size line and support over his top end, I don't know. Uh I think possibly as much land as we're getting and remembering the fact that we're just going to have a house out there. Th possibly these storm cellars could be separate. You know adjacent near the house and they could use it for storage. Might be.. the cleanest way to handle this.

(Participant, man:) I'd say it would be much separate that way. Or else
