

--same thing I want to ask (words not clear).

This is a quote from the Staff of Research. "This is the one thing that they do say that the Agency and Tribal council must rely largely on the oil companies and independent operators for their information data and knowledge of the minerals deposits and structure of the reservation. It is suggested that serious consideration be given to strengthen the minerals branch by signing a will train petroleum engineer economist to give further assistance to the Superintendent and tribal council in achieving maximum benefits and returns for the tribe in the exploration of minerals deposit. At the present time, the tribal council periodically uses the services of a highly competent technical consultant to satisfy the estate. However, occasional consultations are not an adequate means to a task which requires the efforts of high competence in such imagination and training on a full time basis." You see, we have a man up there, and he is a competent man, but maybe he's worked 4 or 5 days out of the last year; but that's not the kind of help we need. What we need is expense money, even if they have to spend 50,000 dollars a year for a competent man to get in there and raise this up and check the oil. You see, we don't have any margin oil out there. No body sees where these tank trucks are going at night. They go all over the entire country and nobody is there to put a hydrolenger in there to see actually what the gravity the oil is or where they're going with it. We take company tickets and that is what the pay roll is made up on. That is not the kind of measure that the Osages really need on this oil business. It is--we ought to get out to see where the pipe lines are and the trucks and everything. This
