

(Unintelligible words), Well, you know, it is funny 'bout this because when I was a kid, I liked the Oklahoma history and I liked Texas history and I still do. And I liked the geography in the way it was written up a long time ago. This geography they got wrote up now aint got any brains to it. You know what I mean ((Laughter)) Any kid that's got any sense at all could go out here in the country and learn just as much or more geography than they can out of them books. See. But, you know, in these geographries we had, we learned 'bout formation of the earth and all that kind of stuff. But, anyway, back to this saddle on - some guy had drilled this hole and then on this saddle has a pipe fitting where you can connect a pipe to it. And then you put a gasket under that. Well, evidently didn't have a very gasket. Anyway, it got to leaking and that was our seepage and that was what filled our well up. Why even when this - the man that came along, that walked the water lines see, - - actually he didn't walk, see. He rode horseback and he came along and was a good friend of my father's. Everybody in that town at that time wa a friend of my dad's.

(What town was that?)

That was Ranger, Texas. We lived there about a couple of years. And my father died and we came back to Oklahoma. Anyway, well, he was a good friend so he said, "I wont even report it." "See, as long as you live here." Well, a couple years after that, you know, my dad died and so I don't know what they ever did do about it. But anyway, that was kinda odd, Now we never hit anything in the digging of that well, except few loose rocks and just sand. There was just pure sand, old blue sand. Now you can do the same thing. You can go down here in these draws - but, you'll get clay. And it is a formation clay that is almost as hard as a rock. There's some right out here that is almost as hard as a rock. There's some right out here 'bout that far
