

are using came from roots and herbs that the things the Indians were using hundreds of years ago.)

Uh-huh.

(So they're finding out it's not so funny after all.)

A CERTAIN TREE - LOOKS LIKE REDBUD TREE. BARK TEA HELPS T.B. PATIENT

No. Well, you know, I know of a tree. Now, my husband had, well he was, well, he was a diabetic. And he had TB, too. And, you know, some of the TB patients spit up blood. And he got that way once. He was really bad. They, there was an elderly lady that worked with these herb medicines and all that. So she took me out to look for something for him to take for that. And, you know, we got the bark off a tree. And it kind of like a wild red bud tree, only the tree altogether is different. You can tell the difference. It seems like it, it's got white flowers, just like a dog wood but they're smaller. And we took the bards of that and made tea out of it. And we boiled it down until it came to just about a quart. And then we got this quart and poured full of this tea. And he start drinking it. You know, that cured him, that stopped him from spitting blood and all that. It was really effective. And I don't know the name of this tree. Even in Cherokee, I don't know what they call it. But I can show anybody if I see it. I can, I know the tree.

(Do you have to out in the mountains to find it?)

Well, this was growing right along the bottom land, you know. Along a creek that was running from there. And it really did help. And just for you know, the coughing and all that. There's a certain kind of herb that they use and they just chew just a little bit of this.

And if you taste it, it tastes like quinine. And so I don't know the name of that either. It's real effective.

(For coughs?)

Uh-huh. For coughs and things like that.
