

some of it might have had to do with the diet during the depression? People didn't get the right kind of food to eat and stuff. It might have caused an unbalance in their chemicals.)

Well, I'll say this much for the Indian people. There was more vitamins, you know, out in the ground that they have eaten. Ten or fifteen years ago, the Indian people were healthy. But nowadays they're sickly. I don't know why. I guess the food that they grew on the farm--I don't know whether they used--put any stuff like chemicals, you know, to make the food grow finer, more healthier looking or something like that. Some of 'em got lot of stuff to grow.

(Too many chemicals and fertilizers?)

Yeah, fertilizers and all that stuff that goes with it. Grow like cut cabbage or potatoes. Back 25 years ago now, the Indian people grew all their garden stuff just out from the ground, see. And I believe in them days the food then was healthier for my Indian people. But now since all these chemicals and fertilizers, you can see, I believe all this diabetic and all this sickness I think might have something to do with it. That is my opinion.

(In other words, you think maybe they're eating more and their stomachs and they're not as hungry as they used to get. But in a way they're not as healthy?)

That's right.

('Cause during the depression you got hungry every once in a while, but when you did get something, it was good. And now you're in doubt as to whether it had its good vitamins and minerals in it or not. Yeah. Sometimes it makes one wonder--)

...market. Say you got a big head of cabbage. You don't know
